

Sentinel AI

The Autonomous AI Investment Committee.

A committee of specialized AI agents — Bull, Bear, Yield, Onchain, Neutral, and Execution — powered by Venice AI, that debate, vote, and execute crypto portfolio decisions on your behalf. Secured by MetaMask Smart Accounts. Scoped by ERC-7715 permissions. Executed via 1Shot Relay. **Fully autonomous. Fully risk-managed. Fully onchain.**

HACKATHON 2024

Made with GAMMA

Crypto Portfolio Management Is Broken

Today's investors face a dangerous combination of fragmented tooling, exhausting manual research, and catastrophic security risks. The current stack was never designed for autonomous, intelligent delegation.

Fragmented Tooling

Traders juggle 10+ platforms — DEX aggregators, portfolio trackers, signal bots, and onchain explorers — with zero unified intelligence layer connecting them.

24/7 Research Exhaustion

Crypto never sleeps. Manual research across Twitter, Discord, onchain data, and news feeds is unsustainable. Missed signals cost real money.

Private Key Exposure

Traditional trading bots require full API key or private key access. One compromised bot = total wallet drain. This risk is non-negotiable.

Single Point of AI Failure

A single LLM-powered bot hallucinating on a trade can wipe out an entire portfolio. There is no consensus, no debate, no safety net.

Introducing the Sentinel AI Committee

Instead of trusting one fallible bot, Sentinel AI deploys a **committee of six specialized AI agents** that debate and vote on every investment decision. Through MetaMask Smart Accounts and ERC-7715 permissions, users delegate funds with strictly enforced on-chain spending limits. The AI cannot rug you — it can only act within your preset risk parameters.

Bull Agent

Identifies long opportunities, momentum plays, and breakout setups across onchain and market data.

Bear Agent

Challenges bullish theses, surfaces downside risks, and votes against overleveraged or speculative positions.

Yield Agent

Scans DeFi protocols for optimal yield strategies, staking opportunities, and liquidity provision alpha.

Onchain Agent

Monitors whale wallets, contract deployments, and onchain signals for early-stage opportunity detection.

Neutral Agent

Provides objective risk scoring and portfolio-level exposure analysis, acting as the tiebreaker vote.

Execution Agent

Translates consensus decisions into intent-based transactions via 1Shot Relay — gasless, frictionless.

✅ **Smart Account Sandboxing:** ERC-7715 permissions enforce hard on-chain spending limits. Users set max position sizes, allowed protocols, and loss thresholds. The AI is powerful — but never unchecked.

How It Works: The Tech Stack

Sentinel AI is built on a purpose-engineered stack of Web3 primitives that enable autonomous, secure, and gasless AI-driven portfolio management.

From user intent to onchain execution in four steps — fully autonomous, fully permissioned, fully gasless.

Venice AI — Uncensored Reasoning Engine

Powers all six agents with uncensored, high-fidelity reasoning. No corporate guardrails filtering market signals. Agents debate freely and vote on consensus.

MetaMask + ERC-7715 / ERC-7710 — Wallet Security Layer

MetaMask Smart Accounts handle session key delegation. ERC-7715 enforces scoped spending permissions. ERC-7710 enables secure agent-to-agent redelegation without user re-signing.

x402 — Autonomous Agent Payments

Agents autonomously pay for premium market intelligence feeds, data APIs, and research tools using x402 micropayments — no user intervention required.

1Shot Relayer — Gasless Intent Execution

Abstracts gas fees entirely. Transactions are paid in USDC and relayed through 1Shot, enabling frictionless, intent-based execution regardless of the user's native token balance.

Why Sentinel AI Wins

Traditional trading bots and portfolio trackers were built for a different era. Sentinel AI combines high-level AI reasoning with hard-coded blockchain security — a combination that doesn't exist anywhere else in the market today.

✗ Traditional Bots

- Rigid If/Then logic with no contextual reasoning
- Full API or private key access required
- Single LLM = single point of catastrophic failure
- No on-chain enforcement of risk limits
- Gas fees paid in native tokens, friction-heavy

✓ Sentinel AI

- Consensus-driven execution: 6 agents debate every decision
- Scoped ERC-7715 permissions — AI can never exceed your limits
- Multi-agent redundancy eliminates hallucination risk
- Hard-coded on-chain policy enforcement via Smart Accounts
- Gasless USDC execution via 1Shot Relay

📌 First-Mover Advantage: Sentinel AI is the first platform to combine high-level multi-agent AI reasoning with hard-coded blockchain security primitives. No existing product offers this combination of autonomous intelligence and on-chain risk enforcement.

Revenue Model: Three Aligned Revenue Streams

Sentinel AI is designed for sustainable, scalable revenue — with every stream aligned to user success. We only win when our users win.

1	2	3
Performance Fees — Success-Aligned A 2% fee is automatically captured from net-positive yield generated by the AI committee. No alpha, no fee. This aligns Sentinel's incentives directly with user outcomes and creates a self-reinforcing flywheel of performance and trust.	Premium Agent Subscriptions — SaaS Users pay a monthly stablecoin fee via x402 to unlock specialized agents: Institutional Whale-Tracking Agent, Arbitrage Agent, MEV Protection Agent, and more. Recurring, predictable revenue with high retention potential.	B2B / DAO Treasury Licensing Whitelabel the Multi-Agent framework for DAO treasuries seeking to autonomously manage idle capital. Enterprise contracts with annual licensing fees, custom agent configurations, and dedicated support — the highest-ACV revenue tier.
2%	\$0	6
Performance Fee	Upfront Cost	Agent Types
Only on net-positive yield	Free to start, pay on results	Specialized AI roles per committee

Roadmap & The Ask

Sentinel AI is built to scale from hackathon prototype to institutional-grade autonomous portfolio infrastructure. Here's where we're headed — and how you can get involved today.

📄  **See It Live:** Our live demo is deployed on **Base Sepolia Testnet**. Watch the agent committee debate and execute in real time. Judges are encouraged to interact with the Smart Account delegation flow and experience gasless execution firsthand.
